

# X. Mini Project-Cricket Performance Analysis

**AIM:**

To clean, process, and visualize cricket match data (runs, strike rate, wickets, economy, formats and venues) using Python, and build static (Matplotlib/Seaborn) and interactive (Plotly) visualizations, along with Power BI and Tableau dashboards, to evaluate player and team performance.

**DOMAIN:**

Sports Analytics (Cricket)

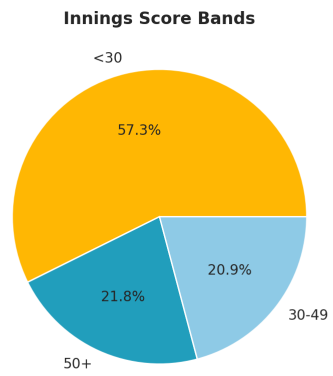

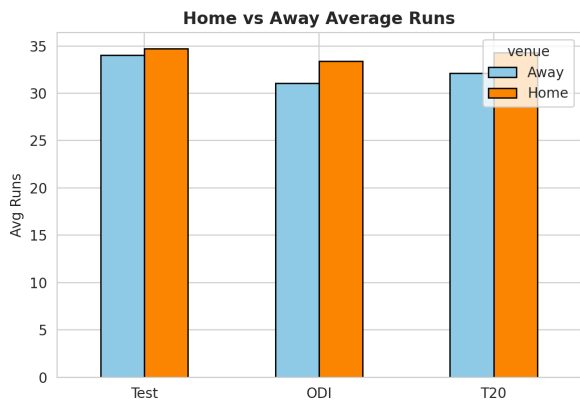

**PROBLEM STATEMENT:**

In modern cricket, selectors, coaches and analysts lack a unified visual dashboard that compares batting, bowling and team performance across formats (Test, ODI, T20), venues and years. There is a need for a data-driven visualization system to identify top performers, format-wise trends, and home versus away advantages.

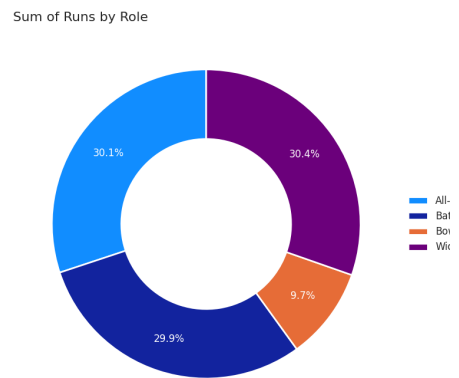

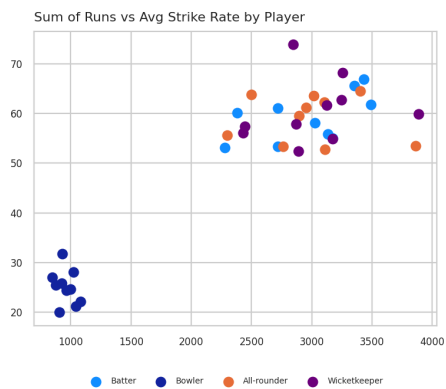

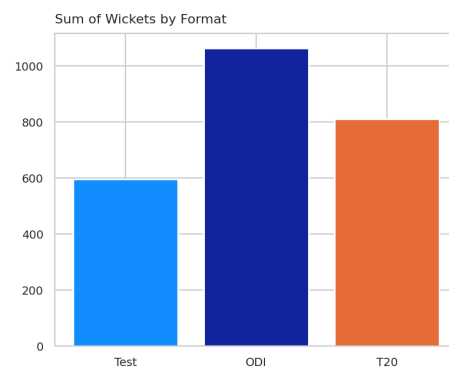

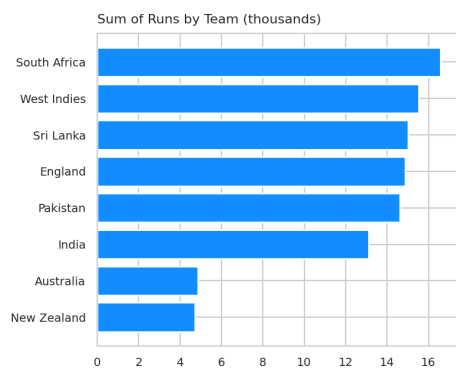

**OUTPUT:**

**Python:**

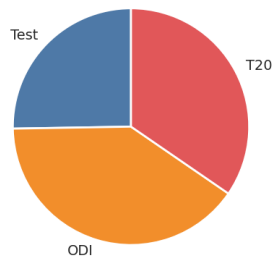

## PowerBI:

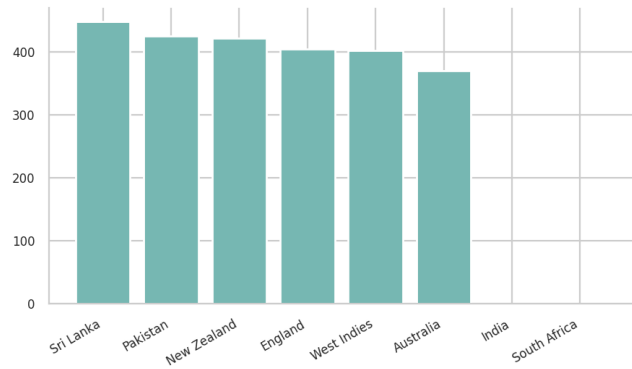

## Tableau:

### Smart Cricket Performance Dashboard

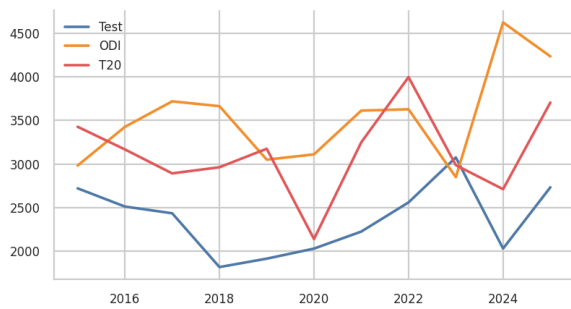

Pie Chart of Formats

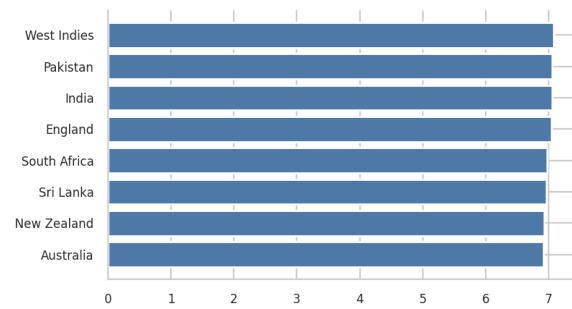

Total Wickets per Team

Line Chart - Runs by Year

Bowling Economy per Team

## RESULT:

Thus, the given program was written and executed successfully.
